

TRANSFORMER GRINDER

A level gauge built into the belt guard cover keeps the grinder housing parallel to the road surface ensuring proper function of the glide wheel system.

Designed to be easily seen from the operators station, it can be adjusted using the hydraulic control joystick inside the skid steer operators station.

The double sided design allows the gauge to work on either side of the grinder housing.

The **TRANSFORMER GRINDER** housing also includes a vacuum dust port. When used in conjunction with the optional tow-behind dust collector, the **TRANSFORMER GRINDER** is virtually dust free. Making it ideal for use in heavy traffic environments.

When not in use, simply cap off the vacuum port with the supplied cover.

The **TRANSFORMER GRINDER** uses five urethane rubber seals to help control dust and debris.

Front, rear, middle, and side seals are all easily user replaceable in the field.

Steel seal retainers help prevent seal warp and tearing of seals.

Thick urethane ensures long seal life.
